

# 3<sup>rd</sup> EGRET Source Catalog

- 271 sources      172 UGO

**ONLY two classes of  $\gamma$ -ray sources  
are certified**

**PWN, SNR,  $\mu$ QSO are probable  $\gamma$ -ray sources**

# What can an unidentified source be

Genuinely **new**  
class of objects

Known objects with a  
**new** phenomenology

**Known**  
(catalogued)  
objects, floating  
in big error boxes

**unknown phenomenology**  
**Multiλλ approach**

known phenomenology  
**VARIABILY**

# GEMINGA (2CG 195+04)

X-ray  
the positioning  
Einstein Observatory 80's

Gamma-Ray  
the discovery  
SAS-2 and COS-B 70's

# Geminga is a success story

3EG J0616-3310:  
146 sources is a confused story

Proper motion  
discovery '92

Egret phasogram, '98  
the optical-gamma connection

237 msec period  
the x-gamma connection

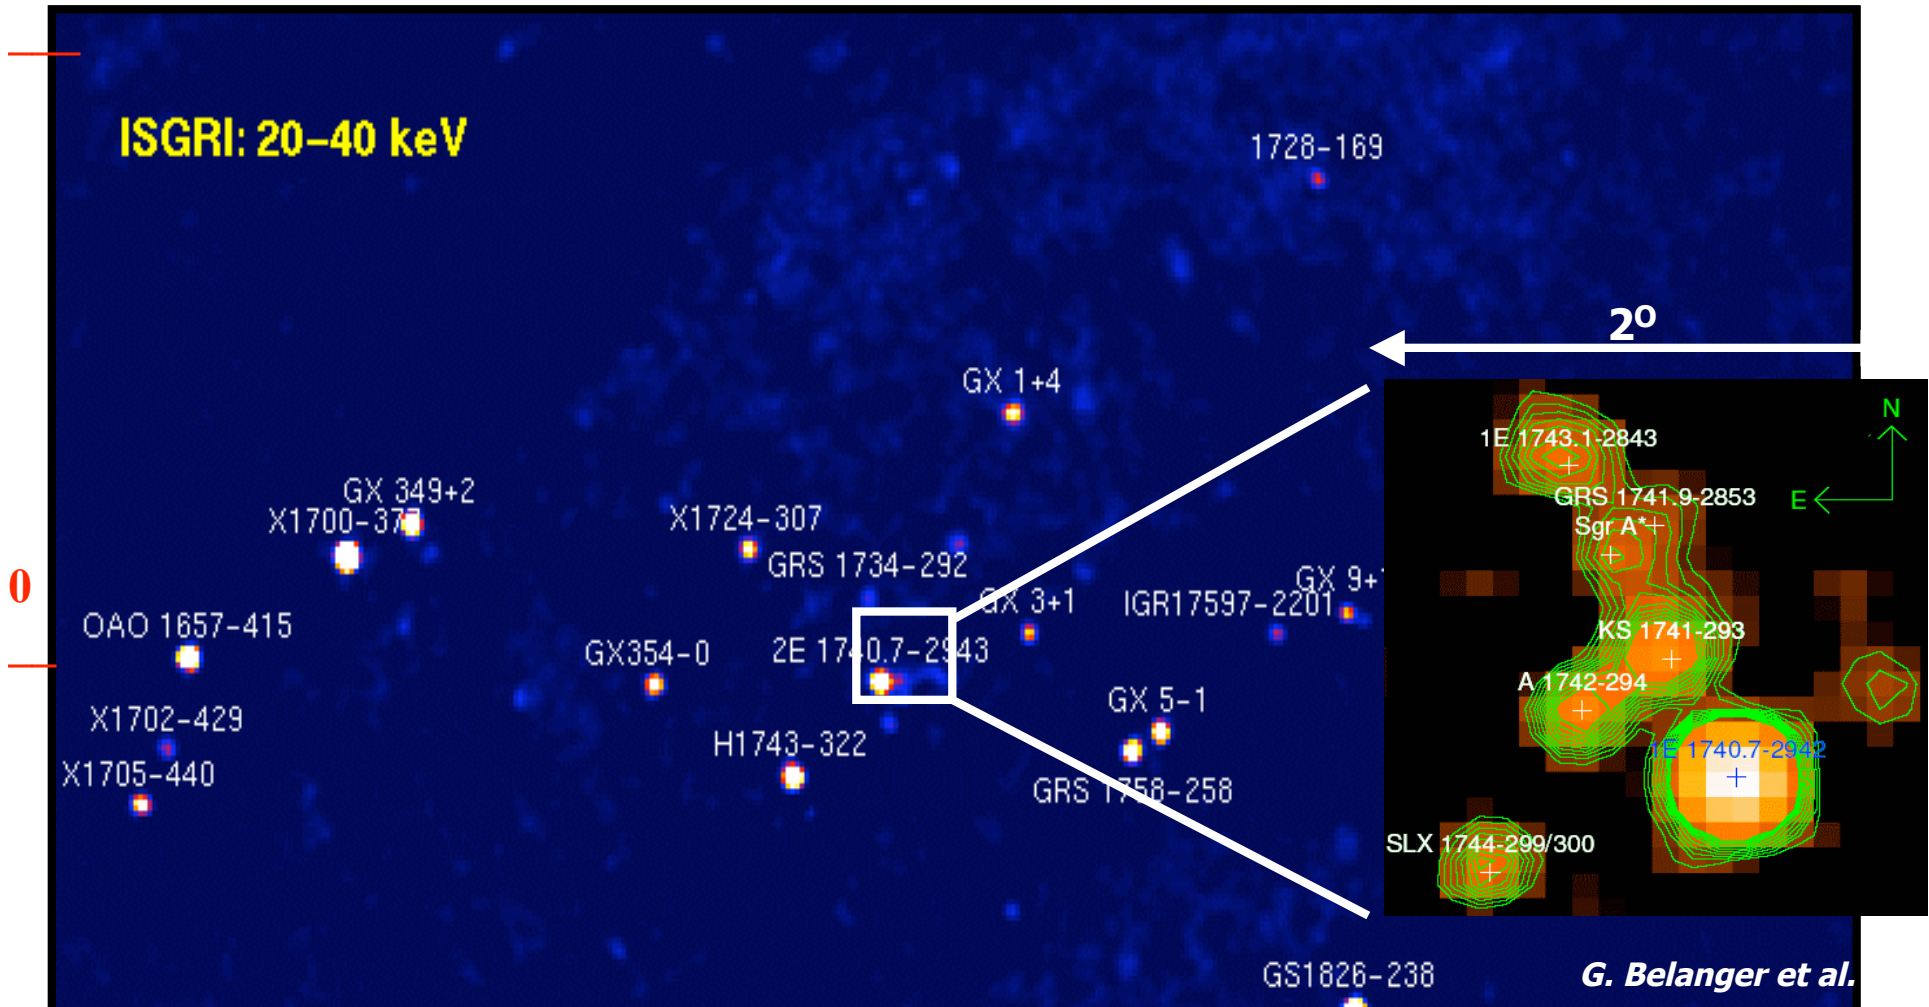

**GlueX will detect hundreds of sources which will be positioned at a 5-10 arcmin level**

10

# INTEGRAL Map of the Central Galactic Region

0

-10

Not enough for a straightforward identification

More work is still needed

# Massive multi $\lambda\lambda$ approach

Requires lot of obs. time (organization)

## Often not conclusive

Shallow XMM observations (10 ksec)  
yield 150 sources /sq deg., i.e.:

- Error radius 10'  $\rightarrow$  15 sources
- Error radius 5'  $\rightarrow$  4 sources
- Error radius 3'  $\rightarrow$  1-2 sources

Optical/radio  
follow-up  
difficult

# Known source classes

## Figure of merit approach

### Smart use of catalogues

#### FoM from:

- educated guesses on c.o.p.
- variability,
- energetics
- extension

FoM suggests **plausible** associations

# From association to identification

Multi $\lambda$  ob's (archival searches) of high  
FoM targets can secure identifications  
(single trial)

Correlated variability

Timing

Extension

**For NEW source classes  
→ Start a multi $\lambda$  campaign**

**e.g.: Swift filler obs time**

# The magnitude of the problem

**End 2007-mid 2008**

**AGILE: 50 new  $\gamma$ -ray sources**

**10 ksec x 50 sources = 500 ksec**

**10% of the filler programme**

**End 2008-mid 2009**

**GLAST: 500 new  $\gamma$ -ray sources**

**10 ksec x 500 sources = 5 Msec**

**100% of the filler programme**

**NOT a GO programme**

**rather a strategic programme**

**in need of a sizeable fraction of the  
filler targets observing time**

**to turn SWIFT into an ID machine**

# **FIRST PRIORITY**

**Identify new classes of sources**

**to start population studies**
